ANCHORED MASONRY VENEER CODE REFERENCES

- **CBC:** 2019 CBC – Chapters 14 and 17
  - 2019 CBC – Chapter 17A (Modified for DSA, OSHPD 1 & 4)
- **TMS 402:** TMS 402 – 2016 Building Code Requirements for Masonry Structures
- **TMS 602:** TMS 602 – 2016 Specification for Masonry Structures

DEFINITIONS

**CBC:** 202  
**VENEER.** A facing attached to a wall for the purpose of providing ornamentation, protection or insulation, but not counted as adding strength to the wall.

**ANCHORED MASONRY VENEER.** Veneer secured with approved mechanical fasteners to an approved backing.

**TMS 402:** 2.2

**Veneer, masonry** — A masonry wythe that provides the exterior finish of a wall system and transfers out-of-plane load directly to a backing, but is not considered to add load resisting capacity to the wall system.

**Veneer, anchored** — Masonry veneer secured to and supported laterally by the backing through anchors and supported vertically by the foundation or other structural elements.

PERFORMANCE and PRESCRIPTIVE REQUIREMENTS

**CBC:** 1402.2  
**Weather protection.** Exterior walls shall provide the building with a weather-resistant exterior wall envelope. The exterior wall envelope shall include flashing, as described in Section 1405.4. The exterior wall envelope shall be designed and constructed in such a manner as to prevent the accumulation of water within the wall assembly by providing a water-resistive barrier behind the exterior veneer, as described in Section 1404.2, and a means for draining water that enters the assembly to the exterior.

Exception: a weather-resistant exterior wall envelope shall not be required over concrete or masonry walls designed in accordance with Chapters 19 [Concrete] and 21 [Masonry], respectively.

**TMS 402:** 12.1.1.1  
**General.**

Provisions of the following apply to anchored veneer, with exclusions:

TMS 402 Part 1 [General Requirements], excluding

1.2.1(c) [Specified compressive strength]

1.2.2 [designed based on specified compressive strength]

TMS 402 Chapter 4 [General Analysis and Design Considerations], excluding:

4.1 [Loading]

4.3 [Section properties]

TMS 402 Chapter 6 [Reinforcement, Metal Accessories, and Anchor Bolts]

12.1.6.1  
**General design requirements.** Design and detail the backing system of exterior veneer to resist water penetration. Exterior sheathing shall be covered with a water-resistant membrane, unless the sheathing is water resistant and the joints are sealed.

12.1.6.2  
Design and detail flashing and weep holes in exterior veneer wall systems to resist water penetration into the building interior. Weepholes shall be at least 3/16 in. (4.8 mm) in diameter and spaced less...
Design and detail the veneer to accommodate differential movement.

Prescriptive requirements for anchored masonry veneer. Prescriptive requirements shall not be used where the velocity pressure, $q_v$, exceeds 40 psf per ASCE 7. See TMS 402 Section 12.2.2.11 Requirements in areas of high winds.

Vertical support of anchored masonry veneer. Weight of veneer shall be supported by concrete, masonry, or other noncombustible structural supports except as permitted:

Preservative-treated wood. Anchored veneer may be supported by preservative-treated wood foundation. Height of veneer shall not exceed 18 ft above such support.

Exterior veneer supported on wood construction. Installed weight of 40 psf (195 kg/m²) or less and height of 12 ft (3.7 m) maximum is permitted to be supported on wood construction. A vertical movement joint in the masonry veneer shall be used to isolate the veneer supported by wood from that supported by the foundation. Masonry is not to be in direct contact with wood.

Interior veneer supported on wood construction. Anchored veneer as an interior finish on wood framing shall have a weight of 40 psf (195 kg/m²) or less.

Lintels. Provide noncombustible lintels or supports attached to noncombustible framing over openings. Lintels shall have a length of bearing not less than 4 in. (102 mm).

Deflection of horizontally spanning support members. Horizontally spanning members supporting anchored veneer shall be designed so deflection does not exceed l/600.

Anchored veneer with a backing of wood framing shall not exceed 30 ft., or 38 ft. at a gable, in height above its support. If anchored veneer with a backing of steel framing exceeds 30 ft., or 38 ft. at a gable, in height above its support, the weight of the veneer shall be supported by noncombustible construction at each story above 30 ft. in height.

Structural. Exterior walls, and the associated openings, shall be designed and constructed to resist safely the superimposed loads required by Chapter 16 [Structural Design].

Fire resistance. Exterior walls shall be fire-resistance rated as required by other sections of this code with opening protection as required by Chapter 7 [Fire-Resistant-Rated Construction].

Water-resistant barrier. A minimum of one layer of No.15 asphalt felt shall be attached to the studs or sheathing, with flashing as described in Section 1404.4, in such a manner as to provide a continuous water-resistant barrier behind the exterior wall veneer.

Masonry. Masonry units, mortar and metal accessories used in anchored veneer shall meet the physical requirements of Chapter 21. The backing of anchored veneer shall be of concrete, masonry, steel framing or wood framing. Continuous insulation shall be permitted between the backing and masonry veneer.

Prescriptive requirements for anchored masonry veneer. Anchors must comply with Section 12.2.2.5 Anchor requirements (see below) and Article 2.4 of TMS 602.

Reinforcement, prestressing tendons, and metal accessories. References ASTM standards for various types of reinforcement, anchors, and ties.

Coatings for corrosion protection. Carbon steel joint reinforcement, ties, and anchors must be galvanized or epoxy coated.

INSTALLATION

CBC: 1404.4 **Flashing.** For masonry, flashing shall be installed in such a manner so as to prevent moisture from entering the wall or to redirect it to the exterior. Flashing shall be installed at the perimeters of exterior door and window assemblies, penetrations and terminations of exterior wall assemblies, exterior wall intersections with roofs, chimneys, porches, decks, balconies and similar projections and at built-in gutters and similar locations where moisture could enter the wall. Flashing with projecting flanges shall be installed on both sides and the ends of copings, under sills and continuously above projecting trim. Self-adhered flashings shall comply with AAMA 711. Fluid applied membranes shall comply with AAMA 714.

CBC: 1404.4.2 Flashing and weepholes shall be located in the first course of masonry above finished ground level above the foundation wall or slab, and other points of support, including structural floors, shelf angles and lintels for anchored veneers.

CBC: 1404.6 **Anchored masonry veneer.** CBC refers to TMS 402 Sections 12.1 [General] and 12.2 [Anchored] veneer for design and detailing requirements (see below).

CBC: 1404.6.2 **Seismic requirements.** Anchored masonry veneer in Seismic Design Category (SDC) C, D, E, or F must meet the requirements of TMS 402 12.2.2.11 [Requirements in seismic areas] (see below).

CBC: 1410.1 [DSA-SS, DSA-SS/CC, OSHPD 1 &4] **Additional Requirements. General.** Anchored or adhered veneer shall not be used on overhead horizontal surfaces.

TMS 402: 12.2.2.5.1.2 **Anchor requirements.** (See also Anchor Requirements chart above.) For solid cmu, corrugated sheet-metal, sheet-metal, and wire anchors shall be embedded into the mortar joint and extend into the veneer a min. of 1 1/2 in., with min. 5/8 in. cover to outside face.

TMS 402: 12.2.2.5.4.2 For joint reinforcement, the longitudinal wires shall have minimum 5/8 in. mortar cover on each side.

TMS 402: 12.2.2.5.5.2 For adjustable anchors, max. clearance between connecting parts of the tie is 1/16 in.
Anchor spacing.

</tr>
</tbody>
</table>

For openings larger than 16 in. either direction, provide additional anchors around perimeter at max. of 3 ft o.c., within 12 in. of opening.

High wind areas: Additional anchors around perimeter at max. of 2 ft o.c., within 12 in. of openings greater than 16 in.

Masonry veneer anchored to...backing. Space between backing and inside face of the veneer:

</tbody>
</table>

* MSJC Commentary to Section 12.1.6 General design requirements addresses the practical difficulty of maintaining a mortar-free 1 in. space. It suggests a wider air space, a vented air space, or use of the rain screen principle.

SPECIAL INSPECTION FOR SEISMIC RESISTANCE

CBC: 1705.12  Architectural components. Periodic special inspection is required during the erection and fastening of interior and exterior veneer in structures assigned to Seismic Design Category D, E, or F.

Exceptions:
1. Not required in structures 30 feet or less above grade or walking surface.

CBC: 1705A.12.5  Architectural components. Periodic special inspection is required during the erection and fastening of interior and exterior veneer in structures assigned to Seismic Design Category D, E, or F.
